14

5.0 Criteria, Equations, Models, Reference Data Input

Program (software) or "burn-in" (chip) into memory device as appropriate criteria, equations, models, and reference data. 136

Proceed to Failure Prediction (B) 16

For probabilistic approach 3.2a and b (response surface FPM, or ST) 88 or 90

For probabilistic approach 3.2c (direct FPM) 92

For probabilistic approach 3.2d (direct ST) 94

Mapping strategy for each variable and response surface equation; statistical distribution of capacity portion of response surface equation; analysis frequency strategy and warning criteria. 138

Variable derivative methodology for FORM, SORM, AMV, or MV analysis; convergence criteria; analysis frequency strategy and warning criteria. 140

Random variable generation methodology for MC or important sampling analysis; number of simulations to be conducted; analysis frequency strategy and warning criteria. 142

Figure 3A

1.0 Central Processing (CPU)

1.1 Input data

25

Read operation and sensor data (from Overall System Computer Control) according to frequency strategy, and map data to appropriate variables.

30

1.2 Prediction Analysis

Use this process for Probabilistic Response Surface.

88, 90

Use this process for Probabilistic Direct FPM.

92

Use this process for Probabilistic Direct ST.

94

Calculate the "Demand" portion of the response surface.

146

Determine POF using FORM, SORM, AMV or MV.

152

Establish reliability or probability of failure (POF). Determine POF using MC or importance sampling.

156

Determine POF at Demand (using CDF equation)

148

Compare POF to exceedence criteria and verified per confidence criteria.

160

Follow appropriate warning criteria.

162

32

1.3 Output Data

Store variable readings, POF and selected warning criteria and warning information into memory device 34.

164

Commute appropriate warning information to Overall System Computer Control.

166

Proceed to 174.
